

# iRooms – Smart Campus

Occupancy tracking using IR sensors to improve resource management

---

## Team 6

Long Nguyen Khac, Vietnam National University, Vietnam

Marcus Reyes, University of the Philippines Diliman, Philippines

Wiphoothorn Sangangam, Kasetsart University, Thailand

# Agenda

---

- Introduction and Motivation
- Problem and Solution
- Demo
- Future Work
- Q & A

# Smart Campus

---

- Security
- Comfort
- Efficiency
- Network connectivity

# Motivation

---

- Tackle a problem that affects a large area
- Rooms, areas that are frequently used
  - Bathrooms, classrooms, etc.
- Areas to target
  - Security
  - Comfort
  - Efficiency
  - Network Connectivity

# Problem

---

Lights are universal. Often they are left on even when unused.

Can we improve the current lighting system using occupancy tracking such that lights turn on and off automatically?

# Goals

---

- Achieve a occupancy tracking system without the need of cameras
- Save energy and electricity by intelligently turning on and off lights, appliances, etc.

## Additional Perks

- Incorporate other sensors that can provide other quality of life updates
  - I.e. Automatic AC

# Proposal

---

Use ESP32C3 and two IR sensors to implement a low cost room tracking occupancy module.

The two sensors allows us to both monitor presence and detect the direction of movement.

# Overview

---

- Two sensors setup close to the entrance of a room
- Order of triggering will indicate direction

Order of triggering	Result
Sensor 1 -> Sensor 2	Person Entering
Sensor 2 -> Sensor 1	Person Leaving

1

2

# Solution

---

- Occupancy Tracking using two IR sensors
- We use two IR sensors to perform directional tracking
- If sensor A is triggered followed by sensor B, the person is entering the room.
- If the reverse happens, the person is leaving the room.
- This will allow us to keep track of the number of persons in the room.

# Solution

---

Entering

People inside: 0

# Solution

---

Entering

Sensor 1 detects a  
person

People inside: 0

# Solution

---

Entering

Sensor 2 detects a person

People inside: 1

Lights turn on.

# Solution

---

Exiting

People inside: 1

Lights are on.

# Solution

---

Exiting

Sensor 2 detects a person

People inside: 1

Lights are still on.

# Solution

---

Exiting

Sensor 1 detects a person

People inside: 0

Lights turn off.

# Solution

---

Exiting with non empty room

Sensor 1 detects a person

People inside: 2

Lights remain on.

# Proof of Concept Prototype

---

- Two IR sensors for occupancy tracking
- A temperature and humidity sensor for potential automatic ACs
- Uploading of data to a website with wifi functionality

# Proof of Concept Prototype

---

# Future Work

---

- Make the system more robust to noisy data
  - Optimize distance between sensors
  - Multiple people coming and going at the same time
- Implement more sensors to make use of occupancy tracking.
- Integrate into hallways to allow intelligent lighting.
- Setup for different types of entrances

# Cost of Parts for the prototype

---

ESP32C3	\$1.95
Tracking IR x2	\$2.88
Temperature and humidity sensor	\$1.42
LED light	\$0.10
Total	\$6.35
